EMOZU

A meltdown should never be the first sign

A soft band that warns a parent minutes before an autistic child's meltdown. At home.

Pre-seed · November 2026 · emozu.kids · Render and concept screen

The problem

Parents find out too late

How it started

"It would be great if there was a device that could predict meltdowns in kids and help prevent them."

A voice message from the founder's brother, about his son.

Then we read what other parents write. We tagged **409 public posts**.

Hunting for triggers

47%

Meltdown with no clear cause

23%

The child often cannot say what is wrong. The parent learns by watching it happen.

Source: our tagging of 409 public parent posts, emozu.kids/research

The cost

It hits the whole family

68%

of autistic children have been aggressive toward a caregiver

42%

of autistic people self-injure, pooled from 37 studies

49%

of autistic children tried to run away after age 4

1 in 31 eight-year-olds in the US has an autism diagnosis. In 2000 it was 1 in 150.

Sources: Kanne & Mazurek 2011 · Steenfeldt-Kristensen 2020 · Anderson 2012 · CDC 2025

The science

A sensor can see it coming

3 min

A wrist sensor predicted aggressive episodes 3 minutes ahead.

70 young people, 4 psychiatric hospitals. AUROC 0.80. JAMA Network Open, 2023.

Every study points the same way

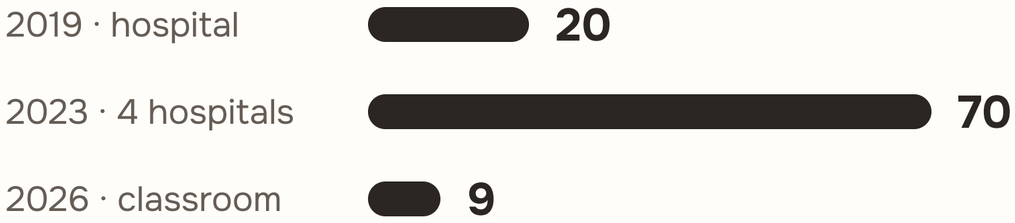

2019	**1 min**	20 young people, hospital unit
2023	**3 min**	70 young people, 4 hospitals
2026	**10 min**	9 young people, classroom, preprint

Signals: heart rate, skin conductance, temperature, motion.

Sources: Goodwin 2019 · Imbiriba 2023 (JAMA Netw Open) · Kartha 2026 (preprint)

Nobody has tested it at home

Children in all published studies: 99

At home **0** the data we collect first

Why now

The research devices are gone. Q-Sensor ended in 2013, Empatica E4 in 2025.

No product a family can buy warns before an episode. The one company left sells only to organizations.

Sensors and AI got cheap. The missing piece is home data.

Sources: emozu.kids/research · Empatica E4 sunset notice

The product

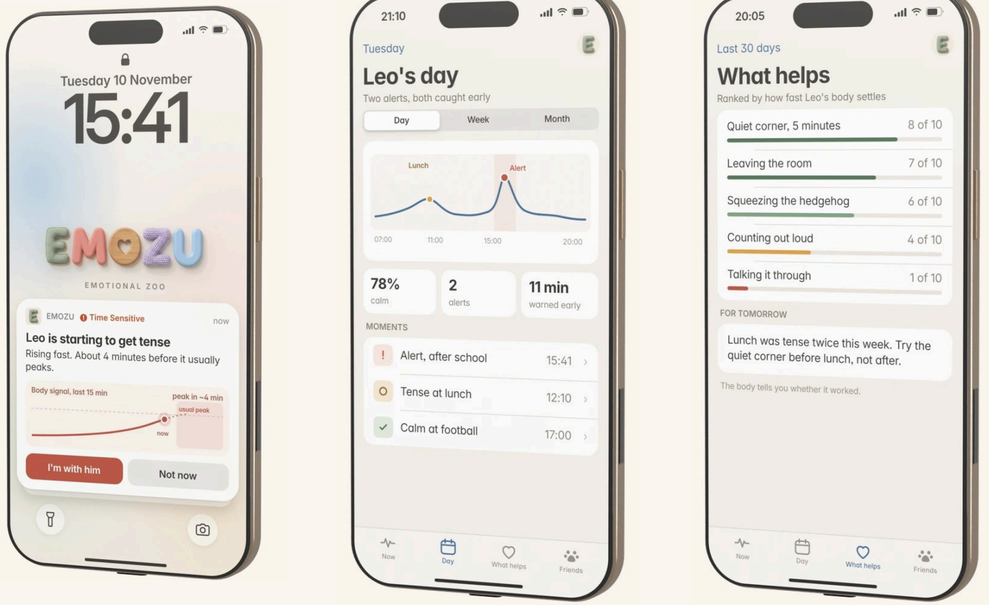

A soft band. A heads-up for the parent

For the child: an animal friend on a soft woven band. No screen. Something to squeeze when it is too much.

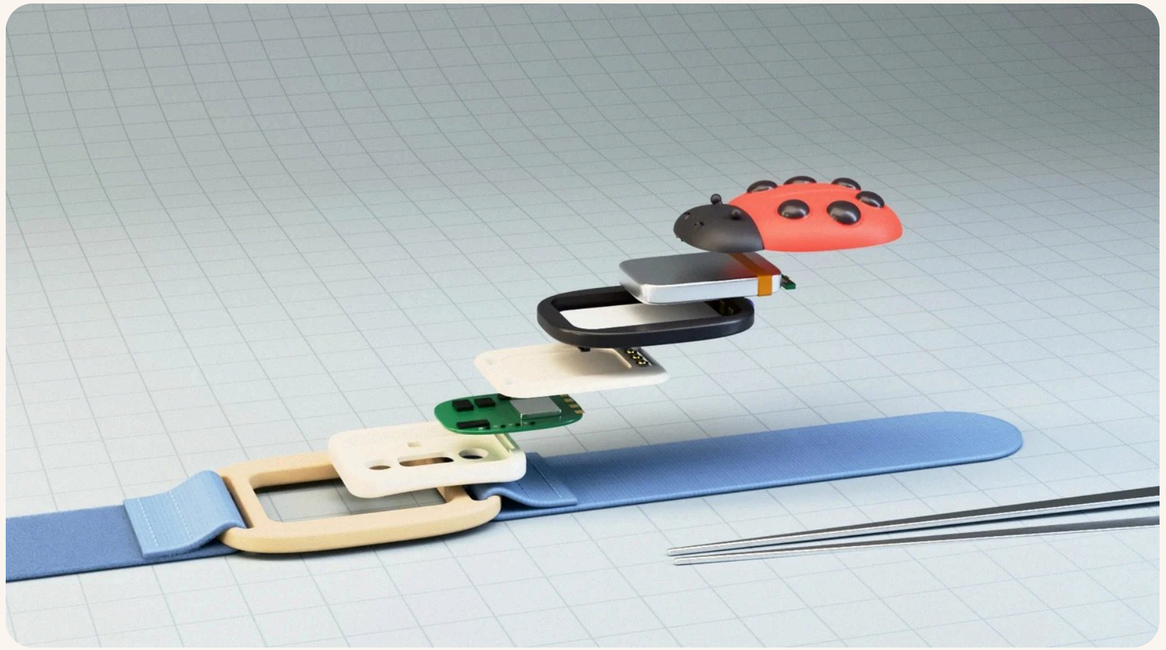

For the parent: a push a few minutes ahead, the day at a glance, and what helps.

7 friends, one band. The friend swaps in one move. Sized for age 6 and up.

Renders and concept screens, not photos. Leo is an invented child.

Designed and ready to prototype

This is our concept. The first prototype will be built on an existing off-the-shelf device with the sensor we need.

Sensor base on the skin: heart rate, skin conductance, temperature, motion.

Swappable friends: each one carries the battery and clicks onto the base.

Sized for a small wrist: 42 × 30 mm frame, curved base.

Concept render of our design, not a photo

Where we are

Ready to build. Ready to test

Design

Prototype design with a component layout in draft. Swappable friends with a battery are designed. Each friend has its own sensory element to touch and squeeze.

Testing

Real families we already work with. A home pilot is running. 6 families are approved for the next stage. We have direct access to a community of 135 families.

People

Clinical experts in Israel and the US. 7 expert calls booked in the first day of outreach.

The landscape

Nobody warns at home, ahead of time

Who	Where it works	What it does	Status
Empatica E4	Clinics and labs	Research wristband behind the key studies	Discontinued in 2025
Awake Labs (Reveal)	Care organizations	Alerts staff from heart rate and skin signals	Sold to organizations only
Mightier	Home	Games that train a child to calm down	On the market, no warning ahead
VOAMO	Home	AI on voice and motion from other wearables	Pre-funding, Tel Aviv
Emozu	**Home**	**Warns the parent minutes ahead, on its own band**	**Home pilot running**

Source: our map of 23 AI projects in autism, November 2026

The model we will test

Starter kit, friends, Care

Starter kit

The band, one friend and the parent app.

New friends

Add-on friends that grow with the child.

Care

A subscription: alerts, the day view, what helps.

Who pays: three bets, in order

1. Parents buy the kit and Care. **2. Clinics and schools** buy for their children. **3. Insurers** after clinical data.

A hypothesis, with no prices yet. The pilot and the study will test it.

The roadmap

From this round to clinical data by fall 2027

Dec 2026

Round closes

Pre-seed closed. Company set up.

Winter to spring 2027

Build

Our own prototypes. Clinics signed up for pilot research with our first prototypes. Beta with 6 families. Study protocol with clinicians.

Spring to summer 2027

Study

Home study with clinical psychiatrists on 30 to 50 children. Ethics approval. Small batch of bands.

Summer to fall 2027

Prove

Results and a paper.

Fall 2027

Seed

We raise the seed with home data and a paper.

What we prove before the seed: how many minutes ahead we warn at home, how many false alerts a day, and how many hours a child keeps the band on.

Raising a pre-seed round

Emozu is a soft band that warns a parent minutes before an autistic child's meltdown, at home. This round takes us from a home pilot to clinical data by fall 2027.

Where it goes

- **Founding team and first engineers**
- **Own prototypes and a small batch**
- **Home study, 30 to 50 children**
- **Clinical science and data**
- **Company, patent, legal**
- **Reserve**
